antho-tech.netlify.app

I build and fix the server side of products — payments, APIs, accounts, realtime, and the parts that break under load. Four years shipping production Go and Postgres systems. **Fixed price, fixed timeline, 50% upfront.** If the work doesn't do what the quote says, you don't pay the balance.

WHAT I DO, AND WHAT IT COSTS

M-Pesa & payments integration — KSh 55,000

7 DAYS

STK push and paybill/till collection, verified callbacks, safe retries so nobody is ever charged twice, automatic matching of payments to orders, receipts, and a daily reconciliation report. Payouts to M-Pesa (B2C) where you need them.

Backend & API build-out — from KSh 80,000

3 WEEKS

A Go API your mobile or web team can build against on day one: database design, endpoints, validation, error handling, deployment and documentation. Ideal when you have a frontend or a Flutter app and no backend engineer.

AI automation — KSh 45,000

1 WEEK · + SUPPORT FROM KSH 10,000/MO

A WhatsApp assistant that takes orders, answers customer questions from your own catalogue or documents, and hands off to a human. Or document work: receipts, invoices and forms read automatically into your system instead of typed.

Stalled project rescue — KSh 40,000

4 DAYS, AUDIT + PLAN

A developer left, the code half works, nobody knows what's true. I read it, tell you honestly what's salvageable and what isn't, fix what's blocking release, and give you a written plan with costs. Delivery work quoted after the audit.

Also available: login and user accounts (sessions, roles, password reset, social sign-in) · live tracking and realtime features over WebSockets · slow database and API rescue · deployment, CI/CD and monitoring setup.

RECENT WORK

Reusable authentication platform

Go service handling registration, login, sessions, tokens and roles for multiple products. Private — walkthrough on request.

Mobility platform architecture

Full backend design for a ride-hailing product: trip lifecycle, dispatch, wallet and M-Pesa payments, built for scale.

Production web platforms

derinance.com and other live systems. Code samples: github.com/anthonyalando8

01

A 30-minute call. You describe the problem; I tell you if I'm the right person.

02

A written scope with a fixed price and a delivery date. No hourly surprises.

03

50% to start, balance on handover. Two weeks of fixes after delivery, free.

Available now for work starting this week.
